## We Claim:

- 1. An optical symbol scanner assembly for detecting and decoding a symbol lying
- on a surface of an article, the symbol comprising a pattern of fluorescent markings
- 3 non-fluorescent surface, said fluorescent markings fluorescing in the presence of
- 4 black light radiation, the assembly comprising:
- a hand-held scanner device having a distal face on which is positioned light-
- 6 generating means for producing illumination to fall on said symbol, said light
- 7 generating means including at least one black-light emitting diode, and focusing
- 8 means for focusing an image of said symbol on an imager device positioned
- 9 proximally thereof within said scanner device, said focusing means defining an
- optic axis; and
- a shield mounted on the distal face of said scanner device, having an optical
- passageway having an optic axis aligned with the optic axis of said scanning device,
- and an illumination channel within the shield for directing and guiding the black
- light emitted by said diodes such that said black light illumination impinges on said
- symbol and the scanner device views the symbol as produced by said fluorescent
- markings.
- 2. An optical symbol scanner assembly according to Claim 1 wherein said shield is
- 2 in the form of a hollow shroud, and includes at a distal end thereof a plate of a
- 3 material that is transparent to said black light illumination.
- 4 3. An optical symbol scanner assembly according to Claim 2 wherein said plate of
- 5 material is oriented at a non-right angle to said optic axis.

- 4. An optical symbol scanner assembly according to Claim 1 wherein said shield is
- 2 formed acrylic material, and is provided with an opaque coating.
- 5. An optical symbol scanner assembly according to Claim 1 wherein said light
- 2 producing means includes a plurality of LEDs that produce illumination in the far
- 3 blue to near ultraviolet region.
- 6. An optical symbol scanner assembly according to Claim 5 wherein said LEDs
- 2 produce illumination between 350 nm and 420 nm.
- 7. An optical symbol scanner assembly according to Claim 6 wherein said LEDs
- 2 produce illumination between about 390 nm and 405 nm.
- 8. An optical symbol scanner assembly according to Claim 1, further comprising an
- optical filter on said optical axis in advance of said imager device for passing light
- 3 fluorescing from said markings, but blocking illumination emitted from said at least
- 4 one diode.
- 9. An optical symbol scanner assembly according to Claim 1 wherein said light-
- 2 generating means includes an array of LEDs mounted at a distal face of said
- 3 housing and spaced from said optic axis.
